

Horizontal TA-MSD by initial GNSS altitude

$$M(\tau) \propto \tau^{2H_{\text{eff}}}; \text{ fit over } 10\text{-}10000 \text{ s}$$

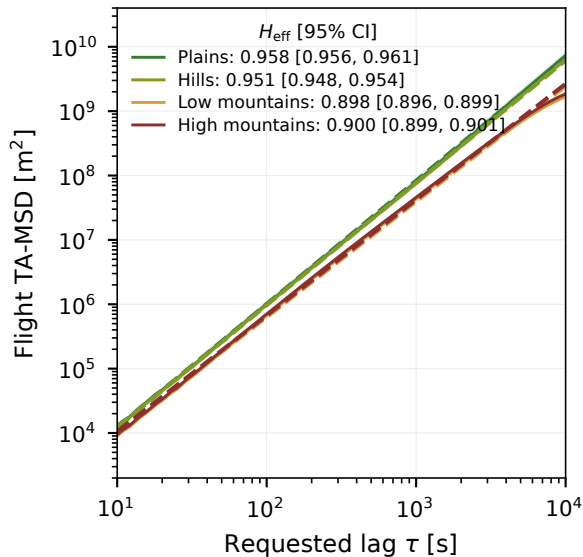

Paragliders: available

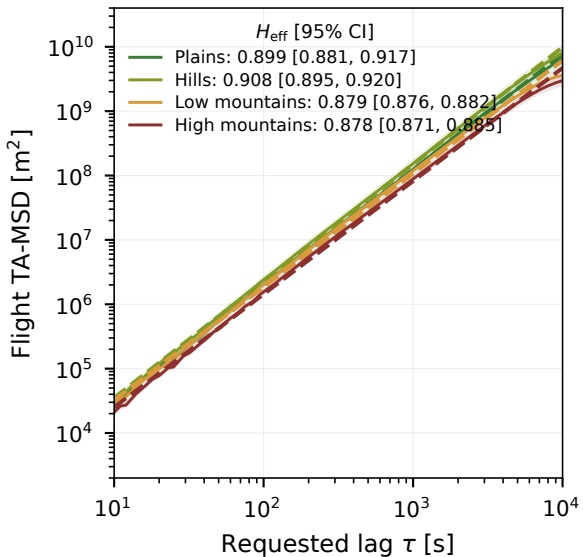

Hang gliders: available

Paragliders: fixed long segments

Hang gliders: fixed long segments

Solid: measured TA-MSD. Dashed: fit at the available lags, 10-10000 s.

Ribbons: pointwise 95% intervals. Exponent CIs: 2,000 site-day draws.

Fixed: same segments supporting lag 10000 s throughout.

Initial GNSS altitude groups pool all regions; they are not terrain classes.
