

Paragliders: TA-MSD by initial GNSS altitude

$$M(\tau) \propto \tau^{2H_{\text{eff}}}; \text{ fit over } 10\text{-}10000 \text{ s}$$

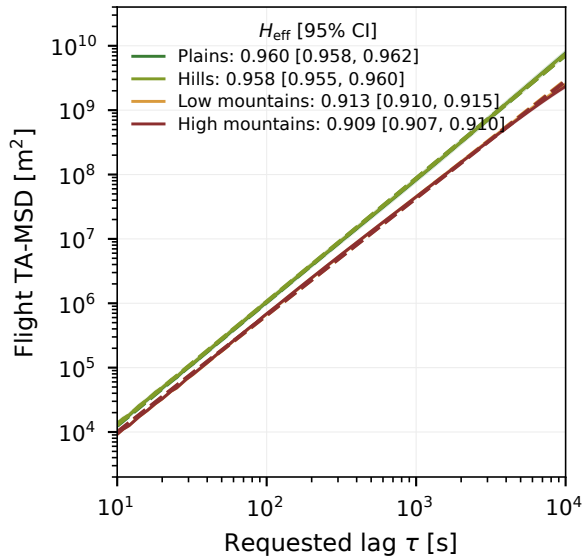

Open circuits: available

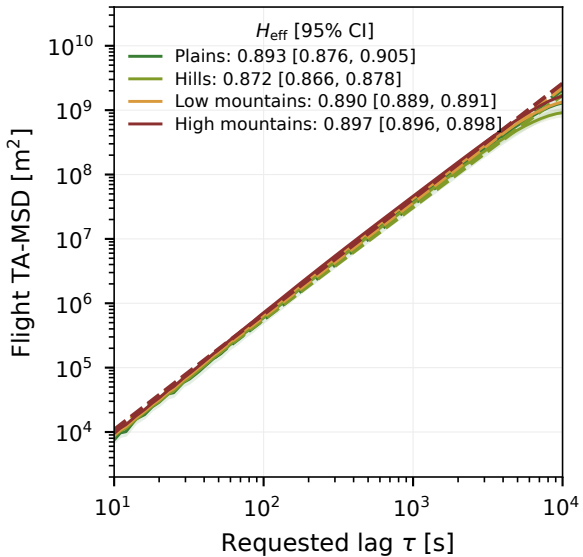

Closed circuits: available

Open circuits: fixed long segments

Closed circuits: fixed long segments

Solid: measured TA-MSD. Dashed: fit at the available lags, 10-10000 s.
 Ribbons: pointwise 95% intervals. Exponent CIs: 2,000 site-day draws.
 Fixed: same segments supporting lag 10000 s throughout.
 Initial GNSS altitude groups pool all regions; they are not terrain classes.
