

Effective scaling: lag range and flight selection

$$H_{\text{eff}} = \alpha/2 \text{ with marginal 95\% site-day intervals}$$

Actual fitted lags: 10-95 s, 107-931 s, and 1049-10000 s (native requested grid).

Dotted line: quadratic growth of the moment. These are range-dependent exponents; the intervals describe sampling uncertainty conditional on the estimator and fit range.
